

1(a) A company wants more customers to be able to find their website on the internet.

When customers contact the company, their computers will use a number of protocols such as TCP/IP and HTTP to make connections with other devices over the internet.

Explain what a protocol is and why they are important in network communications.

[2]

(b) Describe **three** different pieces of networking hardware in a client-server network apart from the clients and servers themselves.

1 .-----

2 .-----

[6]

- 2 A small manufacturing business uses networked computers with closed source application software installed.

All computers owned by the business are connected together into a Local Area Network (LAN). Various network protocols are used in this network.

- i. Give **three** advantages to the business of connecting computers together in a LAN.

1 _____

2 _____

3 _____
_____ [3]

- ii. Explain what is meant by a network protocol.

_____ [2]

- iii. Give the names of **two** protocols that may be used in a LAN.

1 _____

2 _____
_____ [2]

- iv. Explain why protocol layering is used.

[3]

3(a) Zac has an accountancy business. He is moving into an office that has enough space for up to five members of staff. Zac would like to install a Local Area Network (LAN) to allow his staff to work together.

i. A LAN uses packet switching.

Describe **one** difference between packet switching and circuit switching.

[2]

ii. Explain why packet switching is more suitable for a computer network than circuit switching.

[2]

(b) Zac has hired a company that will advise him on what type of LAN he should set up.

Discuss how Zac could set up a peer-to-peer network and a client-server network.

You should refer to the following in your answer:

- how the computers in each type are connected

- Blank lined paper for writing.

9]

- 4 Anika’s computer runs a multi-tasking operating system. She has access to a printer and a broadband internet connection through a wireless connection. The operating system uses scheduling algorithms such as first come first served and round-robin.

Anika uses an encrypted messaging program to communicate with her friends. The computer uses the TCP/IP stack.

- i. Explain what happens at the application layer of the TCP/IP stack when using this program.

[5]

- ii. Explain what happens at the link layer (sometimes referred to as the “network interface layer”, “network access layer” or simply the “network layer”) of the TCP/IP stack when using this program.

[2]

5(a) Modern computer systems use networking in order to share hardware, software and data.

Networking uses protocols such as TCP/IP.

State what is meant by the term 'protocol'.

[1]

(b) The protocol TCP/IP uses a 4-layer stack.

i. Complete the table below to show the 4 layers in the TCP/IP stack.

Application
Link

[2]

ii. Explain **one** advantage of using layers in the protocol TCP/IP.

[2]

6 A company releases an Internet connected fridge. Users can email messages to the fridge and it puts them on its display.

The fridge uses the TCP/IP stack.

Explain what is meant by the term 'TCP/IP stack'.

[3]

The hotel's computer network uses a client-server model.

i. Describe what is meant by the term 'client-server' in this context.

[3]

i. Give **two** advantages of client-server compared to peer-to-peer.

1. _____

2. _____

(b) The hotel's network uses multiple switches.

Explain the purpose of a network switch.

[3]

(c) * The hotel is concerned about the security of its computer network.

Discuss the threats which potentially exist to the hotel's computer network and how these threats could be eliminated or reduced.

[9]

- i. Draw an Entity Relationship Diagram for this database.

[4]

- ii. Define what is meant by the term 'foreign key', giving **one** example of where a foreign key would be used in the hotel booking database.

Definition -----

Example -----

[3]

iii. Describe **two** different ways that hashing could be used in this database.

1. -----

2. -----

[4]

(e) The hotel booking database enforces referential integrity.

Explain what is meant by the term 'referential integrity' and how this could potentially be broken.

[2]

8 In order to view a website, a user enters a website address into their web browser such as `http://www.ocr.org.uk`. The website will then be displayed onto the user's screen.

Explain how the Domain Name System (DNS) plays a role in websites being loaded.

[4]

9 *A company has six solicitors working in two offices in different locations. They work with the general public and help them solve any sensitive legal issues they may be facing.

The solicitors would like to set up a computer network to allow them to work together more effectively.

Discuss the benefits and drawbacks of computer networking to the company.

You should refer to the following in your answer:

- Different networking methods
- Cost implications
- Security implications

Blank lined paper for writing.

10 RestaurantReview is a website that allows users to leave reviews and ratings for different restaurants.

The website uses a database with the following structure.

The database management system ensures referential integrity is maintained.

Each review includes a score out of 5. When the score is entered on the website it is checked in the browser to ensure a number no higher than 5 has been entered. It is then checked again on the server.

- i. State what is meant by the term 'server'.

----- [1]

- ii. Explain why it is important that the review score that the user entered is also checked server-side.

----- [2]

11(a) The internet can be considered an example of a WAN.

Describe what is meant by the term 'WAN'.

----- [2]

(b) The internet uses a set of protocols referred to as the TCP/IP stack. The TCP/IP stack consists of four different layers, each with its own set of protocols.

i. Explain why protocols are important on a network.

----- [2]

ii. State the name of the four layers of the TCP/IP stack.

1

END OF QUESTION PAPER

Mark Scheme

Question		Answer/Indicative content	Marks	Guidance
1	a	1 mark per bullet to max 2: 1 mark for: • A set of rules for communication/ transmission/transfer of data between devices 1 mark max from: • The sending system has no direct control over the way the receiving system responds • Allows standardisation as different devices have different OS/hardware • Protocols allow for data to be exchanged in a predictable way/ in the correct format	2	Not 'a rule' - must be plural MP1 not a set of instructions MP1 accept standards / an agreement <u>Examiner's Comments</u> Most candidates were able to explain that a protocol is a set of rules for communication between devices. Few then went on to explain what that meant and so the majority of candidates gained one mark.
	b	1 mark for hardware and 1 mark for expansion to 6 marks max • Router e.g. • Connect networks together • Assign IP address to devices • Examines data packets and forwards them • Cable/ Ethernet e.g. • Carries digital data from one device/NIC to the next • Connects wired devices to the network • Gateway e.g. • Connects different types of network • Translates protocols from one network to another • Bridge e.g. • Connects different network segments • Repeater • Receives a signal and retransmits it • Network Interface Card // NIC e.g. • Gives each device a MAC address / unique ID • Allows a computer system to interface with a network • Wireless Access Point // WAP e.g. • Allows wireless devices to communicate with each other • Sends and receives radio waves • Examines data packets and forwards	6	2 marks max each. Allow any suitable expansion. Mark in pairs. Allow: Proxy server e.g. • Sits between user and computer to route requests through an external server • Creates separation between a user and the site/service • Protects your security/anonymity by hiding IPs <u>Examiner's Comments</u> The majority of candidates could give three different pieces of networking hardware but many were unable to then describe what they did with many putting connects devices for the description of each piece of hardware.

Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
			them • Switch e.g. • Connects multiple wired devices to the network • Receives data and forwards it to the intended recipient • Examines data packets and forwards them • Routes based on MAC addresses • Hub e.g. • Receives data from a device and broadcasts it to all devices connected to it • Modem e.g. • Changes a signal from digital to analogue • Firewall e.g. • Filters traffic coming in and out of a network		
			Total	8	

Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
2		i	e.g. • Share hardware (e.g. printers) • Share files • Share Internet connection • Centralised security • Log on / access files from any machine on the LAN • Central maintenance • Central backup / storage • Central installation / update of programs • Can monitor user activity • Can control access levels // Centralised useradmin • Access an intranet	3	Mark first answer in each answer space <u>Examiner's Comments</u> This question challenged many candidates who were unable to give three advantages to the business and instead gave 3 benefits of a LAN over a WAN which was not what the question required. The candidates who did manage to gain full marks were able to give clear advantages to a business of having their machines networked in a LAN.  OCR support Link to a resource for features of a computer network can be found in this document on TeachCambridgehttps://teachcambridge.org/item/01e01b94-6f2e-4afa-a765-c11b94aca292
		ii	• A set of rules // an agreement • Used to ensure the (proper / successful) transfer of data between devices // used to govern the transmission / communication between devices • May specify format of data / error checking / etc	2	Allow suitable example of contents of a protocol for MP3 Do not award a rule - must be plural <u>Examiner's Comments</u> This was generally well answered and many candidates were able to gain both marks

Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
		iii	1 mark per protocol listed e.g. • HTTP // Hypertext Transfer Protocol • HTTPS // Hypertext Transfer Protocol Secure • TCP // Transmission Control Protocol • IP // Internet Protocol • UDP // User Datagram Protocol • FTP // File Transfer Protocol • Ethernet • WPA // Wi-Fi Protected Access • DHCP // Dynamic Host Configuration Protocol • SMTP // Simple Mail Transfer Protocol • POP // Post Office Protocol • IMAP // Internet Message Access Protocol • RDP // Remote Desktop Protocol • VoIP // Voice over Internet Protocol	2	Mark first answer in each answer space If mentioned one protocol with 2 versions e.g. IPv4 & IPv6 - only 1 mark If they've written the protocol in full but got any word wrong, no mark awarded <u>Examiner's Comments</u> Generally well answered and it was interesting to see the different protocols candidates were able to name. Some candidates named two of the layers in TCP/IP instead of protocols which gained them no marks.
		iv	• To apply protocols in order / one after the other • To provide independence of layers // Layers can be modified without affecting other layers // Layers are self-contained • Hides details from previous or next layer(s) // is an abstraction • Each layer is well defined / does a specific job • Breaks tasks down into manageable units // Groups similar protocols together • Improved troubleshooting (easier identification of the layer that causes the issue) • Each layer only communicates with adjacent layers// simplifies interfacing • Hardware/software can be manufactured to fit into one specific layer • Allows for standards for individual tasks/layers to be developed // for compatibility	3	<u>Examiner's Comments</u> Protocol layering has appeared in questions in previous papers, but many candidates were not able to explain why they are layered. Some candidates gave a description of the layers in TCP/IP without saying why it was layered.
			Total	10	

Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
3	a	i	◦ In circuit switching dedicated hardware resources are used for each connection ◦ In packet switching hardware is used for multiple different connections. ◦ In circuit switching the data is sent along one route/stream. ◦ In packet switching packets of data may be sent along multiple different routes/packets may not be in order • Circuit switching is less secure if data is intercepted • Packet switching, data is more secure if intercepted/not all packets will be intercepted	AO1.2 (2)	Marks answers in pairs <u>Examiner's Comments</u> Many candidates achieved both marks for this question with most of the responses describing the different routes taken by the data. The candidates who did less well on this question did not understand differences between packet switching and circuit switching.
		ii	• Computer networks would involve multiple connections happening concurrently • In packet switching hardware is not tied up with each unique connection // can handle multiple connections simultaneously • Computers pass vast amounts of data which may encounter transmission errors • Packet switching means only resending individual packets instead of the whole data stream • Computers may be transmitting business critical data • Packet switching means any network hardware failures can be mitigated by routing around it.	AO2.1 (2)	<u>Examiner's Comments</u> Many candidates lost marks for the second part of Question 6 (a) (ii), despite achieving both marks for the first part 6 (a) (i). A lot of incorrect answers gave a very similar response to the first part of the question instead of explaining why the differences that packet switching has, make it more suitable for a computer network. Common correct answers explained that packet switching can route around hardware failures as the data is not sent along a single route.

Mark Scheme

Question		Answer/Indicative content	Marks	Guidance
	b	Mark Band 3–High Level (7–9 marks) The candidate demonstrates a thorough knowledge and understanding of both peer to peer and client server and can give valid application of both in this scenario. All detail are generally accurate and relevant. The candidate is able to apply their knowledge and understanding directly and consistently to the context provided. Evidence/examples will be explicitly relevant to the explanation. <i>There is a well-developed line of reasoning which is clear and logically structured. The information presented is relevant and substantiated.</i> Mark Band 2-Mid Level (4–6 marks) The candidate demonstrates reasonable knowledge and understanding of client server and peer to peer; the material is generally accurate but at times underdeveloped. The candidate may not have applied both to this scenario. The candidate is able to apply their knowledge and understanding directly to the context provided although one or two opportunities are missed. Evidence/examples are for the most part implicitly relevant to the explanation. <i>There is a line of reasoning presented with some structure. The information presented is in the most part relevant and supported by some evidence.</i> Mark Band 1-Low Level (1–3 marks) The candidate demonstrates a basic knowledge of client/server or peer to peer and has made some attempt at applying this knowledge. the material is basic and contains some inaccuracies. The candidate makes a limited attempt to apply acquired knowledge and understanding to the context provided. The candidate provides nothing more than an unsupported assertion. <i>The information is basic and communicated in an unstructured way. The information is supported by limited</i>	AO1.1 (2) AO1.2 (2) AO2.1 (2) AO3.3 (3)	AO1 P2P: • Each computer can act independently • Each computer is responsible for it's own security and login • Each computer will maintain and possibly share its own connected hardware (printer/external storage/internet connection) • Each computer will maintain and possibly share its own secondary storage • If a computer is powered down it's shared resources will not be available. • There are no resources not shared by a peer machine • Adding a machine is simple • Very little administration is needed Client Server: • All network functionality can be provided by servers. • A server is a process running on a machine, usually dedicated to providing these services. • A server machine is designed to never be powered down. • Login/security is handled centrally • Shared storage may be managed by a server • Shared resources (printer/internet connection etc) my be managed by a server • If a server process or machine fails, network functionality, including the ability login is lost • Adding a new machine can mean installing specialist client software and setting up OS policies. • IT skills and a lot of time are needed to administer a client server network AO2 P2P: • As Zak is looking to expand his staff, P2P would offer flexibility in adding staff ad hoc. • Zak's company is still small and may struggle to pay for the IT administrator skills needed for a client server Client Server:

Mark Scheme

Question	Answer/Indicative content	Marks	Guidance
	<i>evidence and the relationship to the evidence may not be clear.</i> 0 mark No attempt to answer the question or response is not worthy of credit.		• As Zak's firm is an accountancy firm it will have sensitive customer data • Client server would allow stronger centralised security • As Zak is taking on multiple staff, they may wish to work collaboratively, which shared storage would allow. • Zak could share a single printer/other hardware with all staff and not worry about an individual computer being switched on. AO3: Candidates can conclude either method, but to score in the top MB must have a clear line of reasoning to justify their choice. <u>Examiner's Comments</u> Candidates were assessed on the quality of their extended response in this question. Although most candidates were able to give a few advantages and disadvantages of the different types of network, few made suitable links to the scenario. Some candidates discussed different topologies which was not relevant to the question. Candidates that were given high marks for this question focused more on the scenario, and made clear links between this and the benefits and drawbacks of the different solutions. Exemplar 3

Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
					~~A peer-to-peer~~ In a peer-to-peer network, computers are connected directly to each other, all connecting to each other either directly or through another computers. This method allows data to be shared easily between computers as ~~there is~~ the data can be sent directly. One of the main benefits of peer-to-peer is that ~~there are~~ is no reliance on a server, this means that, as each computer is independent, if one node fails, the network is still ~~on~~ working. Also, peer to peer networks require little extra hardware so are cheaper to set up. However, security and backups are harder to implement as each computer needs to be backed up individually. The security of data may be important to the firm as they may hold sensitive information such as bank details. In a Client-Server Network, ~~the~~ all the client computers are connected to a centrally managed server. The main advantage of a client-server network is that it has centralised management. This means that backups are easily done as they can be done centrally. Also, security measures are easily put in place as the data is all stored ~~in~~ in one place. However, these ~~network~~ types of network are more expensive as there is extra hardware required and often, specialist skills are required to manage a server so someone needs to be employed to run the server. Also, there is a huge reliance on the server because if the server fails, the whole network will fail. For Zac's business, I think that a peer-to-peer network is more suitable. This is because there are not many people in the office so a peer-to-peer network would be much easier to set up as peer-to-peer networks are only complicated to set up when there are lots of nodes connected. Also, using a peer-to-peer network saves them the added expense of setting up a client-server network. The use of a peer-to-peer network also means they can communicate frequently with their clients without having to worry about the reliance on a server. The candidate response is well structured. The candidate has firstly highlighted how the computers are connected for each type of network and discussed the advantages and disadvantages. The advantages and disadvantages are well balanced and there are clear links to the scenario throughout. The candidate has made a recommendation on the most suitable type of network for the scenario, highlighting the key advantages and showing clear reasoning. The conclusion emphasises the key points and gives a clear justification.

Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
4		i	- Protocol to be used is decided based on the application - E.g. HTTPS for browser based service // SMTP/IMAP for messaging service - Adds encryption - Passes on <u>to</u> transport layer to send - Gets data <u>from</u> transport layer when receiving - Unpacks message ready for display // removes headers or other non-viewable data - Decrypts message	5	For BP2, don't allow HTTP (question mentions encryption). Don't allow a list of protocols which aren't relevant to the question. Don't allow a protocol without its use <u>Examiner's Comments</u> Very few students could explain what happens at the application layer and answers tended to be about splitting data into packets. Some candidates did mention that encryption would take place but didn't go on to mention decryption when receiving data. Those candidates that identified that protocols are applied here were unable to give a specific example and simply listed protocols they knew, but without context.
		ii	- Receives (layered) data <u>from</u> internet layer to send - MAC addresses are added to the packet - Passes and receives data across wireless network (to WAN / other machine) - Passes (layered) data back up <u>to</u> internet layer when receiving	2	Wireless access given in question stem <u>Examiner's Comments</u> Very few candidates were able to gain 2 marks on this question. Some candidates talked about transmitting data via cables, despite wireless being mentioned in the question.

Mark Scheme

Question			Answer/Indicative content	Marks	Guidance				
5	a		• A set of rules (for communication)	1 (AO1.1) (1)	Do not accept instructions instead of rules <u>Examiner's Comments</u> This question was answered well.				
	b	i	1 mark for each completed row up to a maximum of 2 marks: <table border="1"><tr><td>Application</td></tr><tr><td>Transport</td></tr><tr><td>Network</td></tr><tr><td>Link</td></tr></table>	Application	Transport	Network	Link	2 (AO1.1) (2)	– Accept in any order – Accept Internet instead of Network <u>Examiner's Comments</u> Most candidates achieved both marks for this question. The order of the layers was not important to get both marks and many candidates gave “Transport” and “Network” as the two missing layers. Some candidates gave “Internet” in place of “Network” which was also acceptable.
Application									
Transport									
Network									
Link									
		ii	1 mark per bullet up to a maximum of 2 marks, e.g: • Allows different layers to be worked on independently • Allows layers to be replaced/upgraded without affecting others • Allows for layers from different providers to be used interchangeably	2 (AO1.2) (2)	<u>Examiner's Comments</u> This question was generally not answered well. Candidates that did gain marks, focused on the concept of layers being independent. Many candidates missed this concept and did not achieve the marks. Candidates should be careful to use the correct terminology for questions of this type.

Mark Scheme

Question			Answer/Indicative content	Marks	Guidance
11	a		- Wide Area Network - Collection of connected computers/devices over a large geographical area - Often using 3rd party communications channels (1 Mark per -, max 2)	2 (AO1.1)	<u>Examiner's Comments</u> Although most candidates stated that a WAN is a wide area network, many did not go on to state that devices on a WAN are connected over a large geographical area.
	b	i	- Allowing them to communicate - By ensuring all devices follow the same rules/standards - So they interpret data/signals in the same way (1 Mark per -, max 2)	2 (AO1.2)	<u>Examiner's Comments</u> Most candidates explained what a protocol is rather than why they are important on a network. Candidates should be encouraged to apply their knowledge to the question being asked. Some candidates gained credit for correctly explaining that protocols enable devices to interpret data in the same way, allowing them to communicate.
		ii	- Application - Transport - Internet - Network Interface/(Data) Link/Physical (1 Mark per -, max 4)	4 (AO1.1)	<u>Examiner's Comments</u> Most candidates achieved three or four marks on this question, the layers were accepted in any order. Those who did not, invariably scored zero marks.
